Azdome M300S video recorder

Ref: 6973888262287

Azdome M300S video recorder

Gain confidence that your car is safe. The Azdome M300S video recorder will let you record high-quality video from both the front and rear of your vehicle - it offers a 4K front camera and a 1080p rear camera. It also supports voice control and has built-in GPS. It's also compatible with the AZDOME app, which allows you to share recorded footage on social media, among other things.

Top-quality image

Record high-quality images not only from the front, but also from the rear of your car. The front camera of the M300S allows you to record in 4K resolution, and the rear camera in 1080p. This way you can be sure that you won't miss any detail! What's more, the device supports WDR and captures clear, detail-saturated images even in low light.

Voice control

Focus on driving and don't worry about anything - you won't have any problem operating the video recorder! The device supports voice control - now all you need is a simple command to, for example, take a picture or turn on Wi-Fi. You don't have to take your hands off the steering wheel! Note: only commands in English are supported.

Additional features with the app

Do you care about additional capabilities? Download the AZDOME app, which is available in the App Store and Google Play stores! With its help, you can, for example, easily change settings, view recorded videos and share them on social media. The video recorder connects to your smartphone via Wi-Fi, so you don't have to worry about transmission problems.

Around-the-clock monitoring

Take care of your car's safety also in the parking lot. The M300S video recorder allows you to monitor your vehicle even around the clock while parking, and if an accident happens, it will automatically record video of the incident. This will easily provide you with the necessary evidence! Note: in order to use this function, you need to buy additional wiring, available for sale separately.

G-Sensor and loop recording

Record everything you care about. With the built-in G-Sensor, the video recorder detects sudden vehicle movements and can automatically record short videos of collisions and other accidents. Such footage will come in handy when claiming compensation, for example. What's more, the M300S supports loop filming. This means that when you run out of space on the memory card, older footage will be automatically overwritten.
