Smartmi Evaporative Humidifier 2

The Smartmi air humidifier uses an evaporative humidification system to achieve the highest level of humidification. Evaporation consists of sucking in dry air, passing it through humidifying and purifying filters inside the device and then returning it to the environment fully humidified and free from contamination. Improved design allows for more intuitive control. The combination of an innovative motor and a large capacity allows for long operation, which will ensure the right level of humidity.

Modern engine

Innovative and reliable motor using 36 rotating vanes allows for steam ejection imitating that of the natural environment. Release of moisture at 260 ml per hour gives optimal hydration of each room even in a short time.

Cleanliness of all elements

Components exposed to continuous contact with water are manufactured from special materials resistant to bacterial and dirt settling. This ensures that the water remains clean and free of microorganisms up to 99%. In addition, a system has been implemented which dries all wet components inside the humidifier within 8 hours when it consumes all the water. In this way the device will never give off an unpleasant, moist smell.

Easy to use

The device has been equipped with an LED screen which will display the most important information such as percentage of moisture level, mode of operation or the current state of water in the tank. In addition, the screen has all buttons to control the device. The humidifier can also be operated from the Mi Home application even if it is far from the device.

Long working hours

The spacious tank, which holds 4 liters of water, allows for 15 hours of uninterrupted operation of the device, which will easily moisten even large spaces. When there is no water, it can be easily replenished, even while the humidifier is running, thanks to the possibility of adding water through the upper part, where there is a steam throwing hole.

Optimal conditions

The device does not produce fog or accumulate larger water molecules, so that the device and the surface around it remains dry. It is also an ideal tool for allergy sufferers, small children or elderly people, the humidifier does not release harmful bacteria, but allows to maintain the optimal air humidity needed for people with less lung function.

Energy-efficient and quiet

Quiet operation at 34.7 dB gives the possibility to use the humidifier both during the day and night. In addition, the device is extremely energy-efficient, with continuous operation it consumes only 8 W of power, which enables stable and ecological operation.

Manufacturer

Smartmi

Model

Evaporative Humidifier 2

Manufacturer code

CJXJSQ04ZM

Moisturization

Evaporative
