Power charger, Essager, ECT33W-LJB01-Z, GaN, 1xUSB-A, 1xUSB-C, 33W (black)

Essager's 33W AC charger uses advanced GaN technology and provides fast, secure charging via both USB-C and USB-A ports. The product is compatible with a wide range of devices and supports a variety of charging protocols, making it ideal for users of Apple, Android devices and other electronic accessories.

GaN technology - modern solutions

The use of GaN (Gallium Nitride) technology made it possible to reduce the size of the charger while increasing its performance. This makes the device compact and lightweight, so it is ideal for travel. GaN also provides better thermal conductivity, resulting in less heat buildup during operation.

Fast charging 33W

With a maximum output power of 33W, the Essager charger can quickly charge an iPhone 15 to 60% and a MacBook to 50% in as little as 30 minutes. The PD (Power Delivery) protocol dynamically adjusts voltage and current to ensure optimal charging speed.

Multitasking and versatility

The charger is equipped with two ports - USB-C and USB-A, allowing you to charge two devices simultaneously. The USB-C port offers a

maximum output of 33 watts, while the USB-A port provides up to 18 watts. When you use both ports, the charger delivers 15 watts of power for each.

Advanced security systems

Don't worry about the safety of your equipment, the Essager Charger offers a range of safety features, including protection against overheating, overloading, overvoltage, and short circuits. Thanks to a built-in temperature control system, the device ensures stable and safe operation, which is especially important during long-term use.

Automatic voltage adjustment

The charger intelligently recognizes the needs of the devices being charged and automatically adjusts the voltage and current. With six different voltage levels (5V, 9V, 12V, 15V, 20V) and PPS (Programmable Power Supply) technology, the device ensures optimal charging regardless of the type of connected equipment.

Night charging mode

A special trickle charge mode activates when the battery reaches 80% charge to prevent overcharging and prolong the life of the device. This allows you to safely plug in your equipment for charging and sleep without worry.
